

Phylogeny: construction, visualization and interpretation

Introduction to Bioinformatics — Module 1

**Public Health Alliance for
Genomic Epidemiology**

Erkison Ewomazino Odih
22 February 2021

Outline

- Phylogeny inference from SNPs
- Phylogenetic tree construction
- Phylogenetic tree interpretation
- Phylogenetic tree visualization – Microreact

Phylogeny

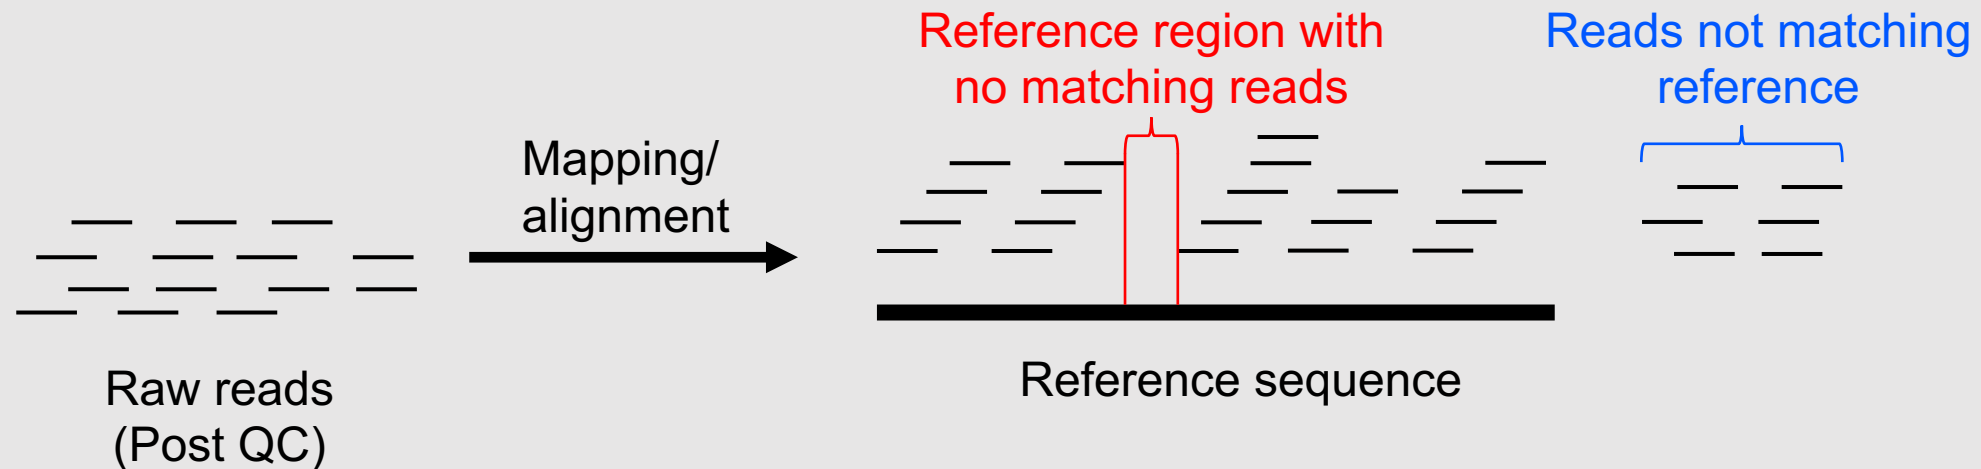

- Phylogeny represents the evolutionary relationships and relatedness between a group of organisms.
- Inferred from single nucleotide polymorphisms (SNPs)
- SNPs are allelic nucleotide variants at given positions in the genome.
- For phylogeny analyses, SNPs are assumed to be:
 - Independent
 - Random

Inferring phylogeny from SNPs – Overview

1. Select reference and map reads to reference

- The closer the reference to the sample data, the better.

Software: BWA mem, samtools, Mauve...

Inferring phylogeny from SNPs – Overview

2. Call SNPs / variant calling and filtering of low quality SNPs

Software: Samtools, VarScan, bcftools...

Inferring phylogeny from SNPs – Overview

3. Filter recombination (optional)

- Remove SNPs due to recent recombination events e.g mobile elements
- Often identified by relative SNP densities (clustering) along the alignment

Software: Gubbins...

Inferring phylogeny from SNPs – Overview

4. Concatenate filtered SNPs to create pseudogenomes and a pseudoalignment.

- Constructed from only shared positions in all genomes and reference

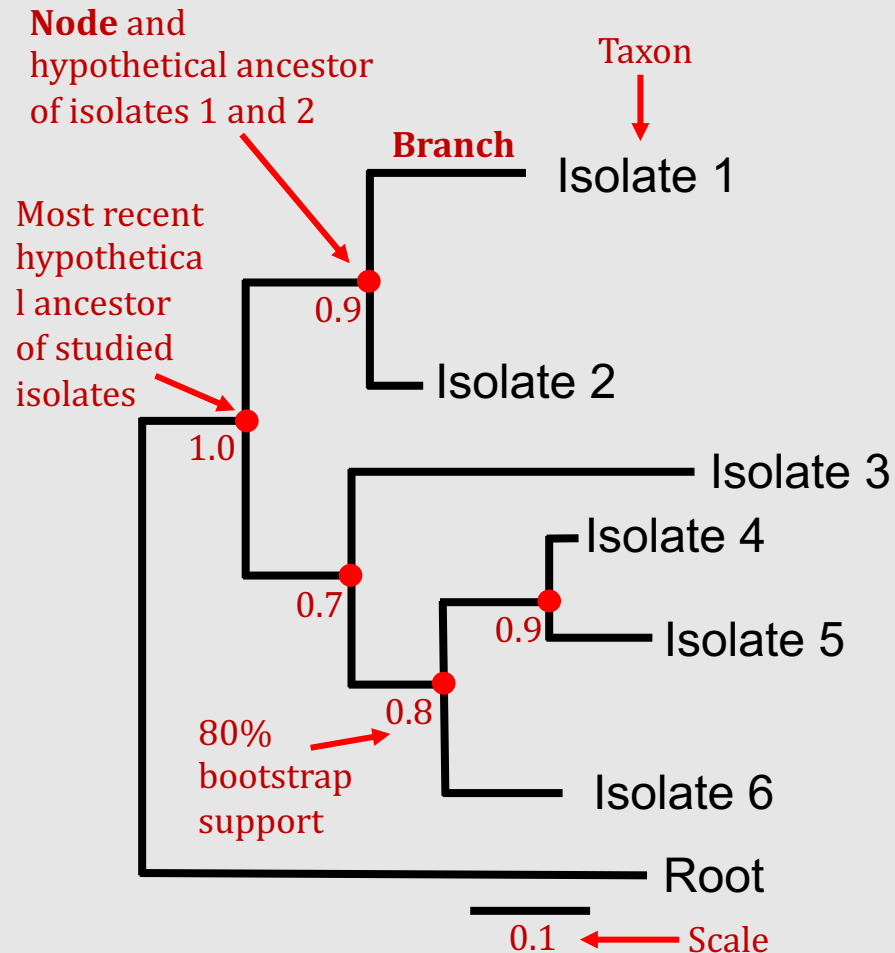

Inferring phylogeny from SNPs – Overview

5. Construct phylogenetic tree from pseudoalignment using chosen algorithm.

Phylogenetic tree interpretation

- **Taxa** are on the tree tips/leaves
- **Nodes**: hypothetical taxa ancestors
- **Branches** connect nodes and taxa
- **Topology**: branching structure of a tree
- **Clade**: taxa sharing a unique common ancestor
- **Bootstraps**: proportion of multiple replicate trees supporting each node.
- **Root**: distantly related to all taxa on the tree; tells direction of evolution

Phylogenetic tree interpretation

Reading phylogenetic trees

- Trees depict branching history; topology most important.
- Different orientations, same topology.
- Unless otherwise indicated, branch lengths are meaningless; avoid inferring temporal information that is not shown
- Branch lengths, when indicated, reflect the amount of evolutionary change as well as the passage of time.

Phylogenetic tree interpretation: Misconceptions

1. Evolutionary timeline flows from tips/leaves

2. Related species have proximal leaves

=
=

Relationships are inferred from common ancestry, not leaf proximity

Phylogenetic tree interpretation: Misconceptions

3. Genetic change occurs only at nodes

Fact:

- Changes accumulate in taxa over time and are present along branches
 - Nodes simply represent (hypothetical) common ancestors between taxa
- - Shared ancestor; divergence event
● - Unique ancestor

4. Related species have fewer connecting nodes

Phylogenetic tree visualisation: Microreact

- A flexible, interactive software/web application for easy visualization of datasets consisting of a combination of trees, maps, timelines, and associated metadata.
- Input:
 - Data file: Comma separated values (.csv) format; can contain a combination of textual metadata, locations and dates.
 - Optional tree file: Newick (.nwk) format.
- Output: interactive tree, map, timeline, and table.

Phylogenetic tree visualisation: Microreact

Sample data file

id	latitude	longitude	Country	Country_colour	Country_shape	Pedalism
Bovine	46.227638	2.213749	France	Red	square	Four
Gibbon	15.870032	100.992541	Thailand	Green	circle	Two
Orangutan	-0.589724	101.3431058	Sumatra	Blue	circle	Two
Gorilla	1.373333	32.290275	Uganda	#CC33FF	circle	Two
Chimp	-0.228021	15.827659	Congo	Orange	circle	Two
Human	55.378051	-3.435973	UK	#CCFF33	circle	Two
Mouse	40.463667	-3.74922	Spain	#00FFFF	square	Four

<https://microreact.org/instructions>

- **Mandatory column**

id – unique identifier for each data row

- **Optional columns**

latitude, longitude – geographic columns

year, month, day – temporal columns

<custom-name> – other metadata

<column-name>_colour – specify colour

<custom-name>_shape – specify shape

Phylogenetic tree visualisation: Microreact

Data file (.csv)

Tree file (.nwk)

Web application

<https://microreact.org>

Source: <https://microreact.org/project/N1TRn11L>

Microreact benefits

- Visualization can be shared as a permanent web link among collaborators.
- The web link can be embedded within publications to enable readers to explore and download the data.
- Provides a simple, yet powerful, visualization method that aids research and discovery and facilitates the open sharing of datasets.
